Summary : Free infrared and submillimeter space missions in the coming decade pdf download - a revolution similar to that brought by ccds to visible astronomy is still ahead in ir and submillimeter astronomy there is certainly no wavelength range which has over the past several years seen such impressive advances in technology large-scale detector arrays new designs for cooling in space lightweight mirror technologies scientific cases for observing the cold universe are outstanding observations in the fir submm range will provide answers to such fundamental questions as what is the spectrum of the primordial fluctuations how do primeval galaxies look what are the first stages of star formation most of the international space missions that have been triggered by these questions are presented in detail here technological issues raised by these missions are reviewed as are the most recent achievements in cooling and detector technologies
