Summary : Free regulatory mechanisms in breast cancer pdf download - in breast cancer cellular and molecular biology kluwer academic publishers 1988 we tried to present an introduction to the emerging basic studies on steroid receptors oncogenes and growth factors in the regulation of normal and malignant mammary epithelium the response to this volume was superb indicating a tremendous interest in basic growth regulatory mechanisms governing breast cancer and controlling its malignant progression in the two years since its publication much new and exciting information has been published and the full interplay of regulatory mechanisms is now beginning to emerge we have divided this book into four sections that we hope will unify important concepts and help to crystallize areas of consensus and or disagreement among a diverse group of basic and clinical scientists working on the disease the first section is devoted to studies on oncogenes antioncogenes proliferation and tumor prognosis the first chapter by sunderland and mcguire introduces the characteristics of breast cancer as studied by pathologists to establish prognostic outcome of particular interest is a new proto oncogene called her-2 or neu which is rapidly becoming accepted as a valuable new tumor marker of poor prognosis the second chapter by lee bookstein and lee introduces the best known antioncogene the retinoblastoma antioncogene whose expression is sometimes lost in breast cancer malignant progression appears to be influenced by the balance of proto oncogene and antioncogene expression
